#### **DETAILED ACTION**

This Office Action is in response to the application filed under 35 U.S.C. 371(c) on August 18, 2005, Application Number: 10/546,391 (hereinafter referred to as "application") Publication Number: US 2006/0077330 A1. The application is in the national examination stage of PCT/IB04/50119, filed on February 2, 2004, Publication Number: WO/2004/077124 published on September 10, 2004. Page and line number references made in this action relate to the originally filed application, not to either publication. No claims have been cancelled and no claims have been added. Therefore original claims 1-14 are examined in this Action. Receipt is acknowledged of the information disclosure statement filed on October 4, 2006.

# **Priority**

1. Receipt is acknowledged of papers submitted under 35 U.S.C. 119(a)-(d), which papers have been placed of record in the file.

#### Oath/Declaration

2. The oath or declaration is defective. A new oath or declaration in compliance with 37 CFR 1.67(a) identifying this application by application number and filing date is required. See MPEP §§ 602.01 and 602.02.

The oath or declaration is defective because:

It does not state that the person making the oath or declaration acknowledges the duty to disclose to the Office all information known to the person to be material to patentability as defined in 37 CFR 1.56.

3. Appropriate correction is required.

Application/Control Number: 10/546,391 Page 3

Art Unit: 2629

## Claim Objections

4. Claims 13 and 14 are objected to because of the following informalities: each claim improperly depends on itself. Appropriate correction is required. For purposes of examination, claims 13 and 14 will be understood to be dependent on independent claim 12. Correction is illustrated in the Office Action by underlying the modification and bracketing the originally submitted text.

## Claim Rejections - 35 USC § 103

- 5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 6. Claims 1, 2, 3, 4, 5, 6, 7 and 8 are rejected under 35 U.S.C. 103(a) as being unpatentable over Sheridon, (5,757,345), hereinafter referred to as Sheridon '345, and further in view of Pamula et al., (US 6,911,132 B2) hereinafter referred to as Pamula '132.
- 7. With regard to claim 1, Sheridon '345 clearly teaches display unit (see Abstract and further see column 1, lines 39-48) comprising at least one electro-wetting pixel (1300) (see column 2, lines, each electro-wetting pixel comprising: a closed cell (1303) (see FIG. 10 element 78 described further at column 6, lines 1-42); a polar liquid (see column 3, lines 30-38 describing the liquids) and a non-polar liquid (1301, 1302) (see column 3, lines 30-38 describing the liquids), said liquids being immiscible (see column 3, lines 30-38 describing the

Art Unit: 2629

liquids), having different optical properties (see column 3, lines 30-38 describing the liquids' properties) and being contained in said cell (see FIG. 10 element 78 further described at column 6, lines 1-42); a counter electrode (1306) (see FIG. 10, element 70 further described at column 6, lines 47-62); and at least one electrode pair (see FIG. 10, elements 66 further described at column 6 lines 48-52), each electrode pair comprising an address electrode (1304) (see FIG. 10 further described at column 6, lines 1-48) electrodes being separated from said liquids by a surface (1307) (see FIG. 1, element 18, further described at column 5, lines 15-42) that is lyophobic in relation to only one of said liquids (see FIG. 1, element 18, further described at column 5, lines 15-42).

- 8. However, Sheridon '345 differs from the claimed invention in that Sheridon '345 does not explicitly teach a retain electrode (1305), wherein said address and retain electrodes are arranged at respective electric potentials to control a spatial distribution of said liquids and thereby defining a multi-stable pixel state.
- 9. In the same field of endeavor, Pamula '132 clearly teaches a retain electrode (1305) (see column 8, lines 56-end and continued at column 9, lines 1-4 describing third electrode), wherein said address and retain electrodes are arranged at respective electric potentials to control a spatial distribution of said liquids and thereby defining a multi-stable pixel state (see column 8, lines 56-end and continued at column 9, lines 1-4 describing operation of multi-stable pixel state).
- 10. It would have been obvious to one having ordinary skill in the art at the time the invention was made to have been motivated to incorporate additional electrode as taught by Pamula '132 into the display device of Sheridon '345 because both are within the same field of

Art Unit: 2629

endeavor and furthermore because of improved control of the droplets positioning and reconfigurability thereby enhancing image quality (see Pamula '132 at column 5, lines 30-47).

- 11. With regard to claim 2, Sheridon '345 in view of Pamula '132 clearly teaches a display unit according to claim 1 (see above), wherein said at least one electrode pair is arranged to provide one active multi-stable pixel state (see column 8 lines 55 to end and continued at column 9 lines 1-4).
- With regard to claim 3, Sheridon '345 in view of Pamula '132 clearly teaches a display 12. unit according to claim 1 (see above), further comprising a control unit which is operative to apply potentials to the address and retain electrodes in relation to the counter electrode of each pixel (see Sheridon '345 in FIGs. 1 and 14 illustrating V1 and V2 respectively further describing addressing circuit at column 6 58-end and continued at column 7, lines 1-4; or additionally see Pamula '132 at column 7, lines 6-26 describing electrode selector); and to set each pixel in either of at least one active multi-stable pixel state, by means of an address potential applied to said address and retain electrodes in relation to the counter electrode of the respective pixel (see Sheridon '345 generally for electrode arrangement and additionally see Pamula '132 at column 8, lines 56 -end and continued at column 9, lines 1-4 describing drive method), and a passive multi-stable pixel state, by means of removing any potential from the address and retain electrodes in relation to the counter electrode of the respective pixel (see Sheridon '345 at column 4, lines 25-35 describing removal of the electric field); and to retain a current multi-stable pixel state in each pixel by means of applying a retain potential to each retain electrode only of the respective pixel (see Pamula '132 at column 8, lines 56-end and continued at column 9, lines 1-4).

Art Unit: 2629

13. With regard to claim 4, Sheridon '345 in view of Pamula '132 clearly teaches a display unit according to claim 1 (see above), wherein the display unit comprises a plurality of pixels and wherein the pixels are arranged along rows and columns in a matrix configuration (see Sheridon '345, FIG. 2 further described at column 2, lines 53-65).

Page 6

- 14. With regard to claim 5 Sheridon '345 in view of Pamula '132 clearly teaches a display unit according to claim 1 (see above), wherein each pixel further comprises at least one additional electrode pair (1412, 1422; 1413, 1423) (see Sheridon '345, FIG. 14 illustrating additional electrodes 162 and additionally electrodes 156 available for each of three droplets 170, 172, 174), each pair comprising a retain electrode (1422; 1423) and an address electrode (1412; 1413) (as illustrated in FIG. 14, elements 156 as divided would serve to create two separate electrodes per elements 170-176), wherein the address and retain electrodes in each pixel are consecutively arranged so that the address electrodes are spatially separated from each other by retain electrodes and vice versa (it would be obvious to one having ordinary skill in the art at the time of invention to create such a similar repeating pattern for the commonly understood benefits of simultaneous addressing of similar electrodes in a pixel arrangement), and wherein each electrode pair provides for a multi-stable pixel state (see Pamula '132 at column 8, lines 55-end and continued at column 9, lines 1-4).
- 15. With regard to claim 6, Sheridon '345 in view of Pamula '132 clearly teaches a display unit according to claim 5 (see above), wherein the retain electrodes within each pixel is electrically interconnected with each other (it would be obvious to one having ordinary skill in the art at the time of invention to interconnect electrodes for the commonly understood benefits of simultaneous addressing of similar electrodes in a pixel arrangement).

Art Unit: 2629

16. With regard to claim 7, Sheridon '345 in view of Pamula '132 clearly teaches a display unit according to claim 4 (see above), wherein every retain electrode within each pixel arranged along the same row is electrically interconnected with each other (it would be obvious to one having ordinary skill in the art at the time of invention to interconnect electrodes for the commonly understood benefits of simultaneous addressing of similar electrodes in a pixel arrangement).

Page 7

- 17. With regard to claim 8, Sheridon '345 in view of Pamula '132 clearly teaches a display unit according to claim 4 (see above), wherein every counter electrode within each pixel arranged along the same row is electrically interconnected with each other (it would be obvious to one having ordinary skill in the art at the time of invention to interconnect electrodes for the commonly understood benefits of simultaneous addressing of similar electrodes in a pixel arrangement).
- 18. Claims 9, 10, and 11 are rejected under 35 U.S.C. 103(a) as being unpatentable over Sheridon '345 in view of Pamula '132 as applied to claim 1 above, and further in view of Kawanami et al, (US 6,603,444 B1) hereinafter referred to as Kawanami '444.
- 19. With regard to claim 9, Sheridon '345 in view of Pamula '132 clearly teaches a display unit according to claim 1 (see above). However, Sheridon '345 in view of Pamula '132 differs from the claimed invention in that Sheridon '345 in view of Pamula '132 does not explicitly teach wherein said liquids in each pixel have different indices of refraction and define a lens and wherein each pixel state is controlled by said lens.

Art Unit: 2629

20. In the same field of endeavor, Kawanami '444 clearly teaches wherein said liquids in each pixel have different indices of refraction (see column 3, lines 10-57) and define a lens (see column 3, lines 10-57 and wherein each pixel state is controlled by said lens (see FIGs. 3A and 3B further described at column 6, lines 20-end and continued at column 7, lines 1-45).

Page 8

- 21. It would have been obvious to one having ordinary skill in the art at the time the invention was made to have been motivated to incorporate the refraction indices as taught by Kawanami '444 into the device of Sheridon '345 in view of Pamula '132 because all are within the same field of endeavor and furthermore because Kawanami '444 improves light modulation of the display device (see Kawanami '444 column 1, lines 58-end).
- 22. With regard to claim 10, Sheridon '345 in view of Pamula '132 and further in view of Kawanami '444 clearly teaches a display unit according to claim 9 (see above), further comprising a light guide (see FIGs. 3A and 3B element 309, mask, further described at column 6, lines 20-end and continued at column 7, lines 1-45), and wherein said electrodes are operative to move the lens between an ON state in which the lens is operative to focus light from the light guide towards an exit surface of the cell (see FIG. 3B further described at column 6, lines 20-end and continued at column 7, lines 1-45) and an OFF state in which the lens is operative to spread light from the light guide away from the exit surface (see FIG. 3A further described at column 6, lines 20-end and continued at column 7, lines 1-45).
- 23. With regard to claim 11, Sheridon '345 in view of Pamula '132 clearly teaches a display unit according to claim 1 (see above), wherein said liquids have different light filtering properties and wherein the spatial distribution of the liquids provides a controllable light

Art Unit: 2629

filter which defines said pixel state (see FIG. 4B describing color filter 404 further described at column 7, lines 47-end and continued at column 8, lines 1-2).

- 24. Claims 12, 13, and 14 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kawanami '444 and further in view of Pamula '132.
- 25. With regard to claim 12, Kawanami '444 clearly teaches a method for bistable addressing of at least one electro-wetting pixel (see column 3, lines 58-end and additionally continued at column 4, 1-8 in conjunction with FIGs. 1A, 1B, 1C), each pixel comprising an address electrode (1304) (see column 2, lines 49-61 describing substrate 103), and a counter electrode (1306) (see column 2, lines 39-49 describing opposed electrode 108), in which an active state is set by applying a potential to the address electrode and the retain electrode in relation to the counter electrode (see FIG. 1B further described at column 3, lines 64-end and continued at column 6, lines 1-13); and in which a passive state is set by removing any potential from the address electrode and from the retain electrode in relation to the counter electrode (see FIG. 1A further described at column 3, lines 41-56).
- 26. However, Kawanami '444 differs from the claimed invention in that Kawanami '444 does not explicitly teach a retain electrode (1305) and the method further comprising the step of retaining a current state by applying a potential to the retain electrode in relation to the counter electrode and removing any potential from the address electrode in relation to the counter electrode.
- 27. In the same field of endeavor, Pamula '132 clearly teaches a retain electrode (1305) (see column 8 lines 56-end further continued at column 9, lines 1-4 describing a 3<sup>rd</sup> electrode) and

Art Unit: 2629

to the retain electrode in relation to the counter electrode and removing any potential from the address electrode in relation to the counter electrode (see column 8 lines 56-end further continued at column 9, lines 1-4, the third electrode continues to receive applied potential).

- 28. It would have been obvious to one having ordinary skill in the art at the time the invention was made to have been motivated to incorporate addressing method and electrode as taught by Pamula '132 into the display device of Kawanami '444 because both are within the same field of endeavor and furthermore because of improved control of the droplets positioning and reconfigurability thereby enhancing image quality as taught by Pamula '132 (see Pamula '132 at column 5, lines 30-47).
- 29. With regard to claim 13, Kawanami '444 in view of Pamula '132 a method for bistable addressing according to claim [13] 12 (see above), wherein a plurality of pixels in a display device are addressed during picture frames (see Kawanami '444 FIG. 3C), the method comprising the consecutive steps of: setting each pixel to an active state; setting a subset of said pixels to a passive state; and retaining each pixel in its current state (see Kawanami '444, FIG. 3C, it would be obvious to one having ordinary skill in the art at the time of invention to address individual picture elements to achieve the commonly understood benefits of such a modification including increased control and variation of addressing individual display elements and creating or modifying a mosaic of elements to create a distinct design for the user).
- With regard to claim 14, Kawanami '444 in view of Pamula '132 a method for bistable addressing according to claim [14] 12 (see above), the pixels being arranged in a matrix having rows and columns and the pixels being addressed one row at a time (see Kawanami

Art Unit: 2629

'444, FIG. 3C, it would be obvious to one having ordinary skill in the art at the time of invention to address rows one at a time for the commonly understood benefits of such a modification including increased control and variation of addressing individual display elements and linearly driving display elements to reduce redundancies in design).

### Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Sarvesh J. Nadkarni whose telephone number is 571-270-1541. The examiner can normally be reached on 8:00-5:00 M-Th EST.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Amare Mengistu can be reached on 571-272-7674. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.

### **Privacy Act Statement**

The Privacy Act of 1974 (P.L. 93-579) requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

- The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act
  (5 U.S.C. 552) and the Privacy Act (5 U.S.C. 552a). Records from this system of records may be disclosed to the
  Department of Justice to determine whether the Freedom of Information Act requires disclosure of these records.
- A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.
- 3. A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.
- 4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).
- 5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.
- 6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).
- 7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (i.e., GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.
- 8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspections or an issued patent.
  - 9. A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.
